

CHAPTER 7: Memory Management

1. What is memory management?
2. Differentiate between fixed-size partitioning and dynamic partitioning technique. Identify their weakness.
3. A dynamic partitioning scheme is being used, and the following is the memory configuration:

U	H	U	U	H	U	H	U	U	H	U	H	
0K	10K	40K	58K	100K	145K	200K	250K	273K	480K	570K	700K	825K

The following process requests will be received in order:

<u>Process Number</u>	<u>Size in Kilobytes</u>
1	35
2	20
3	10
4	80

Show how the memory request above is allocated using each of the allocation schemes (one process per element):

- i) First Fit (FF)
- ii) Best Fit (BF)
- iii) Worst Fit (WF)

4. Given memory allocation in one computer system:

H	H	U	H	H	H	U	U	H	U	H	U	H	
0K	25K	50K	70K	90K	100K	150K	160K	180K	200K	205K	215K	240K	280K

* U - Used

* H - Hole

The following process requests will be received in order:

<u>Process Number</u>	<u>Size in Kilobytes</u>
1	18
2	40
3	15
4	20
5	35

Show how the memory request above is allocated using each of the allocation schemes (one process per element):

- i) First Fit (FF)
- ii) Best Fit (BF)
- iii) Worst Fit (WF)
